Professional C#-Simon Robinson 2001 If we were to describe the C# language and its associated environment, the .NET framework as the most important new technology for developers for many years we would not be exaggerating. .NET is designed to provide a new environment within which you can develop almost any application to run on Windows, while C# is a new programming language that has been designed specifically to work with .NET. Using C#, you can write, for example, a dynamic web page, a component of a distributed application, a database access component, or a classic Windows desktop application. Between them C# and .NET are set to revolutionise the way that you write programs and to make programming on Windows very much easier than it has ever been. This book should equip you to program in C#, while at the same time providing the necessary background in how the .NET architecture works. It covers not only the fundamentals of the C# language, but also goes on to give examples of applications that use a variety of related technologies - including database access, dynamic web pages, advanced graphics, and directory access.

Delphi Memory Management-Dalija & Neven 2018-06-24 Memory management. One of the most basic parts of software development, often kept on the side even though it has the most profound effect on how we write our code. Delphi provides a variety of types with their own memory management logic, as well as two sets of compilers that provide different memory management systems for classes. * Classic Delphi compiler currently supported on Windows and OSX platforms - using manual memory management while providing ARC for certain types. * Next generation ARC Delphi compiler supported on mobile Android and iOS platforms, as well as Linux - using full ARC - Automatic Reference Counting memory management system. Each memory management system has its good and bad sides. Each offers solutions to some problems, but creates a whole range of other problems. And each requires slightly different coding patterns and practices. Knowing the strengths and weaknesses and understanding how memory management system(s) work goes hand-in-hand with writing clean, bug-free and maintainable code. Both compilers are covered in detail, as well as coding patterns required for writing cross-compiler code that must run under both. From manual memory management, to garbage collection, different memory management systems differ not only by the general category they fall in, but also by implementation. And all those fine implementation details also have a great impact on actual code. From the perspective of the everyday software development process discussing memory management is impossible without discussing its specific implementation in specific languages and toolsets.

Literate Programming-Donald Ervin Knuth 1992-01 Literate programming is a programming methodology that combines a programming language with a documentation language, making programs more easily maintained than programs written only in a high-level language. A literate programmer is an essayist who writes programs for humans to understand. When programs are written in the recommended style they can be transformed into documents by a document compiler and into efficient code by an algebraic compiler. This anthology of essays includes Knuth's early papers on related topics such as structured programming as well as the Computer Journal article that launched literate programming. Many examples are given, including excerpts from the programs for TeX and METAFONT. The final essay is an example of CWEB, a system for literate programming in C and related languages. Index included.

Overcoming Uncertainty of Institutional Environment as a Tool of Global Crisis Management-Elena G. Popkova 2017-09-03 This book is the result of recent research by contemporary scientists on topics which were discussed at the conference of the same name in Volgograd, Russia in April 2017. The global economic system is currently in a stage of active formation and development: its boundaries and conditions of existence are constantly changing, which is accompanied by crises that influence the economic systems of its member countries. In order to solve problems emanating from global economic crises, a new direction was formed in modern science – global crisis management. Development of this direction requires the formation of the accompanying categorical apparatus, the development of a corresponding scientific and methodological basis, and the engagement in extensive practical research.
